VTERM II II
 http://vetusware.com/download/VTERM%20II%20II/?id=14708
VTERM is a PC telecommunications program designed to emulate the DEC VT100 and interface with Digital Equipment Corporation systems. In addition to emulating a terminal, it supports binary file transfers. VTERM was primarily targeted at large corporations that also owned, used, or interfaced with large VAX VMS or PDP systems.   VTERM II supports baud rates up to 9600, and file transfers using ASCII, VTRANS7, VTRANS7, or XMODEM. Later versions supported the Kermit file transfer protocol.   IMPORTANT: These disks contain copy protection and no unprotect is known to exist. To properly reproduce these disks, you must use one of the provided Kryoflux, SCP, Transcopy, ImageDisk, or CopyIIPC images.
