NC Gopher 2.6
https://vetusware.com/download/NC%20Gopher%202.6/?id=18230
NCGopher v2.6 - tfurrows@sdf.org - Public domain
=== NCGopher is a simple gopher client for DOS, made for the sole purpose of having a client with decent speed that runs on an 8088. It is modeled after the VF-1 gopher client to a degree. It depends heavily on mTCP's netcat utility, hence the NC name. Here is what you need to use NCGopher: * 8088 or 80x86 based machine with 640kb of RAM (less?) * DOS (only tested on 6.22, but older versions should work) * Ethernet card, installed and configured * Working and running packet driver for ethernet * mTCP from Michael Brutman, https://www.brutman.com/mTCP/ * mTCP configuration to match your network, nc.exe working. This latest version has an option in the CFG file for a QUIET mode, to support the bundled NCQ utility (a custom compiled version of mTCP's NC utility, with a -quiet argument.) You can still use this with the normal Netcat (NC) from mTCP by setting "QUIET=0" in the configuration. See the included .TXT files for details.
