Universal SoftPC 2.52

<http://vetusware.com/download/Universal%20SoftPC%202.52/?id=14995>

This is Universal SoftPC 2.52. It's Universal in that it'll run on any 68k based Macintosh. There is no PowerPC version of this. It includes MS-DOS 3.30 and a FAT driver for MacOS. It's a very basic PC emulation, limited to a maximum of 640kb of RAM, and CGA graphics. Use the password q520e0i44ek4 to activate. Archive is a zip file with a BinHex archive, with a SEA archive, which then contains discopy 4.2 images. Sorry my only machine that can read 800k disks is ancient.
