Typestry is a 3D software program released in the 1990s by Pixar for Apple Macintosh and Windows [1]-based PC computer systems ($299 US). Unlike general purpose modellers and renderers, Typestry concentrated on rendering and animating text entered by the user in multiple fonts. The fonts were extruded into three dimensions, with various bevel styles and textures applied during rendering. Typestry creates 3D text with Type 1 and TrueType fonts and can do many different effects.
