Prism 1.5

<https://vetusware.com/download/Prism%201.5/?id=18371>

Prism has all the usual editing features found on software sequencers - quantising, copying, transposing - with two very important pluses: it behaves very much like a Macintosh program, and it has an excellent manual. Prism works on all classes of PCs and compatibles (IBM PC, XT, AT and so on) and also on IBM's most recent offering, the PS/2. It requires at least 384K of RAM within which to run (although 512K is the practical minimum), as well as a graphics card and any available MIDI interface.

Texture 4.25

<https://vetusware.com/download/Texture%204.25/?id=18372>

DOS-based MIDI sequencer by Roger Powell. It will only work on older DOS or Windows computers that are outfitted with a true Roland MPU-401, Music Quest MQX16 or MQX32, or equivalent MIDI interface, or a Yamaha C1. Included is TXNOMPU, Texture with the playback and recording features disabled, for converting Texture Files to MIDI files. This version can run on more modern computers with no MPU-401 hardware present.
