VT52 Device Driver V3.12

<http://vetusware.com/download/VT52%20%20Device%20Driver%20V3.12/?id=13145>

VT52.SYS is a device driver that enables your local DOS console to behave as a VT52 terminal. It works in a similar way to the MS-DOS ANSI.SYS, and should be loaded in place of it. This software may be required by some very early DOS programs that were designed for 8088/8086 based non-IBM compatible MS-DOS machines, several of which used VT52 style communications with their display. This version appears to be from ~1987 and was found with some software for OS/2.
